                                                                                                                                                                                                                                                                                                             CC from human breast and BY 474 cells. The method involves contacting cc the probes with a collection of detectably labelled nucleic acids cc derived from mRNA of human breast, and then measuring the label cc bound to each probe of the microarray. The probes are useful for cells are useful for yearifying the expression of regions of genomic DNA predicted to ce encode proteins. They are useful for gene discovery, and for ce encode proteins. They are useful for gene discovery, and for ce expression analysis is useful for assessing the toxicity of chemical catermining predisposition and/or prognosing breast disease. Gene ce expression analysis is useful for assessing the toxicity of chemical catermining probes for measuring gene expression, with far less bias ct than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. CC Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the invention is the properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                04-FEB-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      멂
  measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probe for measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                           04-FEB-2000;

                                                                                                                                               measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, mentioring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                 Single

                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the

The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printe specification, but was obtained in electronic format directly from WIPO at fire, wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to single exon hucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             04-FEB-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SS
```

The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the prohybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, breast. The probes are useful for predicting, diagnosing, grading,

CC probes: Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a cc sample derived from human lung; comprising (a) contacting the array with a cc a collection of detectably labeled nucleic acids derived from human lung; measuring to comprising (a) contacting the array with a cc a collection of detectably labeled nucleic acids derived from human lung comprising (a) contacting the array with a cc a collection of detectably bound to each probe of cc in the array; identifying exons in a eukaryotic genome, comprising cof the eukaryote; and (b) detecting specific hybridisation of detectably collected an ucleic acids from eukaryote lung mRNA, to a single exon probe, comprising (a) identifying exons from genomic sequence by the method cc above and (b) measuring the expression of each probe is included tissues and/or cell types using hybridisation to a single exon cc microarray; having a probe with the exon, where a common pattern of cc expression of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single gene; a peptide comprising one of 12011 sequences, mentioned in the specification, or encoded by the expression analysis, and for identifying exons in a gene, particularly using human lung derived mRNA and for the study of lung diseases (CCOPD), interstitial lung disease (ILD), familial idiopathic pulmonary disease. Pulmonary disease, Hermansky-Pudlak syndrome, fibrocystic pulmonary disease, Hermansky-Pudlak syndrome, sarcoidosis, pulmonary candina frame of the invention.

CC hamonary alveolar proteinosis, Karagener syndrome, is a single exon con be open reading frame of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    03-AUG-2000;

Patent No. 6294354

GENERAL INFORMATION:

APPLICANT: Chugai Selyaku Kabushiki Kaisha, 5001, Iwamoto et

TITLE OF INVENTION: Cell Calcification Suppressing Proteins and Genes

FILE REFERENCE: chugai selyaku Kabushiki kaisha 5001

CURRENT APPLICATION UNMBER: US/08/878,177

CURRENT FILING DATE: 1997-06-18

NUMBER OF SEQ ID NOS: 7

Sequence 3, Application US/08878177

Patent No. 629434

GENERAL INFORMATION:

APPLICANT: Chugai Seiyaku Kabushiki Kaisha, 5001, 1

TITLE OF INVENTION: Cell Calcification Suppressing

TITLE OF INVENTION: the Proteins

FILE REFERENCE: chugai seiyaku kabushiki kaisha 500

CURRENT APPLICATION NUMBER: US/08/878,177

CURRENT FILING DATE: 1997-06-18

NUMBER OF SEQ ID NOS: 7

SOFTWARE: Patentin Ver. 2.0

LENGTH: 1528
                                                                                                                                                                                                                                                                                                                     ; LENGTH: 1528

Patent NO. 6384204
GENERRAL INFORMATION:
APPLICANT: Deneris, Evan S.
APPLICANT: Fyodoro, Dmitry V.
APPLICANT: Hendricks, Timothy J.
TITLE OF INVENTION: Reagents and Methods for the Screening of Compounds
TITLE OF INVENTION: Useful in the Treatment of Neurological Diseases
FILE REFERENCE: CASE-04027
CURRENT APPLICATION NUMBER: US/09/435,335
CURRENT FILING DATE: 1999-01-05
EARLIER FILING DATE: 1999-07-26
RUMBER OF SEQ ID NOS: 23
GOVERNMENT DATE: DATE: 1999-07-26
                                                                                                                                                                                                                                                                                                                                                                                   SOFTWARE: PatentIn Ver. 2.0
